

MANAGE NETWORK SECURITY POLICIES FROM WITHIN SERVICENOW

Integrating your IT service management tool and network security policy management solution breaks down siloes and accelerates application delivery while increasing your organization's security posture. Application owners rely on tools they already know, while security owners need the business context to ensure that they make the right decisions. Discover the best of both worlds today with the out-of-the-box AlgoSec and ServiceNow integration.

Integrating the AlgoSec Security Management Suite with ServiceNow lets you:

- Automate security policy change management within ServiceNow
- Enrich your security management with business context
- Work with your existing processes and workflows and accelerate the adoption of security policy change management

Automate Security Policy Change Management

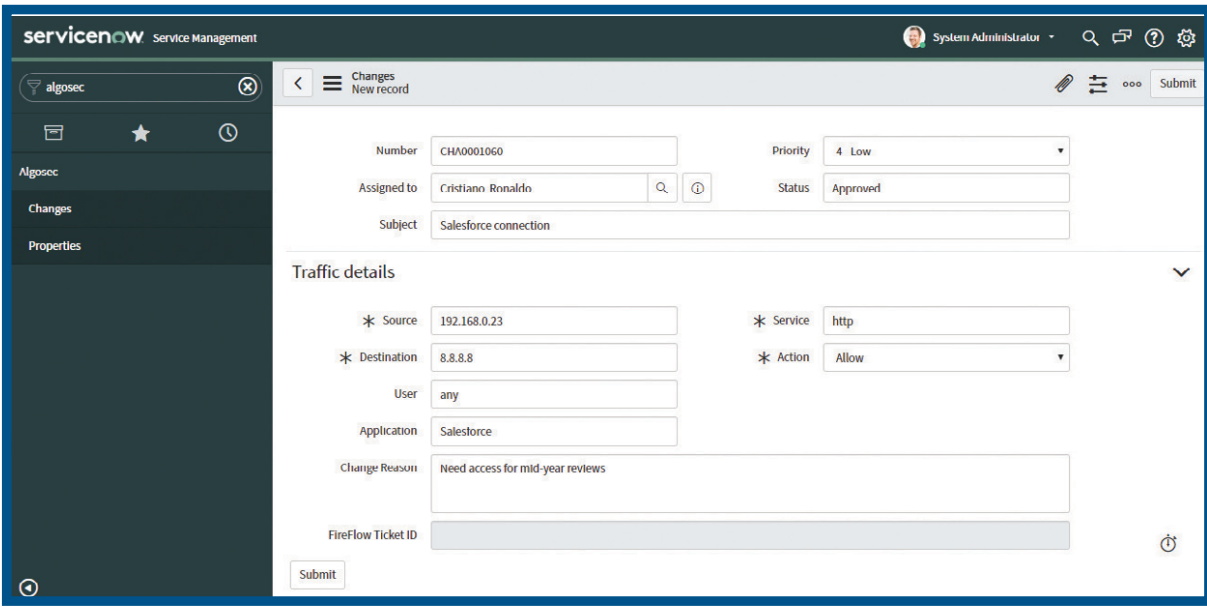

Change management processes are slow. Processing a single change in a complex enterprise environment can take days or even weeks.

Using intelligent, highly customizable workflows, AlgoSec automates the entire security policy change process — from planning and design through submission, proactive risk analysis, implementation, validation, and auditing — all with zero-touch. AlgoSec's intelligent automation enables you to reduce change requests processing time to minutes, prevent guesswork and manual errors, reduce risk, and enforce compliance.

Integrating AlgoSec with ServiceNow lets you manage the entire security policy change process while remaining entirely within the tool your team is already using: ServiceNow.

KEY BENEFITS

- Rapidly deploy applications through intelligent automation of network security change management processes – all from within ServiceNow
- Avoid security device misconfigurations and outages
- Facilitate effective communication between security teams and application owners
- Tie security incidents directly to business processes
- Ensure full transparency of security statuses, changes and risks throughout your organization
- Monitor SLA, workload, and other organizational KPIs

Enrich your security policy management with your existing business context

Ensure your change requests have the required fields for your existing business processes. Maintain business-critical information throughout your security policy change process. This provides further context to your security policy change requests.

Faster adoption of automated security policy change management

By working with the tools that your organization is already familiar with, you don't need to learn new workflows and user interfaces. Continue to use the tools you already know. This accelerates adoption and organizational buy-in for automated network security policy change management. As a result, you can bridge the gaps between application and security owners and enable application agility while maintaining a strong security posture.

Comprehensive Support for Heterogeneous Environments

AlgoSec seamlessly integrates with all leading brands of traditional and next-generation firewalls and cloud security controls as well as routers, load balancers, web proxies and SIEM solutions, to deliver unified security policy management across any hybrid-cloud, multi-cloud, SDN and on-premise network. Additional devices can be added via the AlgoSec Extension Framework.
